

Modelling Daily Rain-gauge Network Measurement Responses Under a Changing Climate - K5/1964

Geoff Pegram

27 September 2013

Pegram
& Associates

How to stop this

... from turning to this?

A partial response

What management can we put in place?

How do we plan and design for water security in a changing environment?

At least try and make an educated guess of what the future holds

How?

What do we need?

Sequences of modelled future spatial rainfall
over catchments give flows in rivers

How to do this?

Harness information from Climate Models
even though they give mixed messages

What did *we* do?

Local solutions with global impact

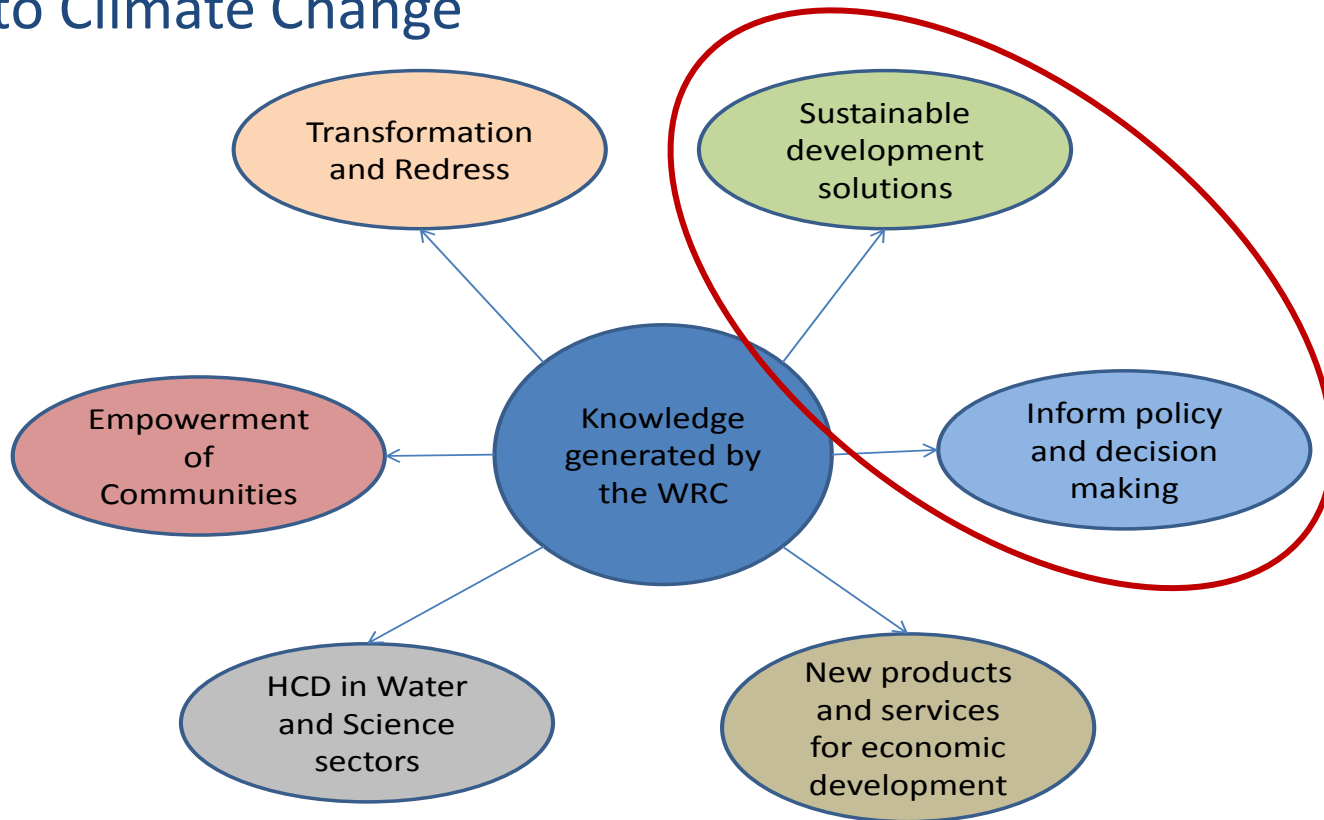

GCMs and RCMs offer rainfall estimates which are typically biased

We offer a method to remove the bias without destroying the trend or delta/shift

Engineers and Hydrologists can use the tool to create 'what-if' scenarios with rain gauge estimates they are comfortable with

Sensitivity and uncertainty analyses are by-products of the method

Modellers, Engineers and Decision makers will have a set of tools to better quantify changes to rainfall on the ground due to Climate Change

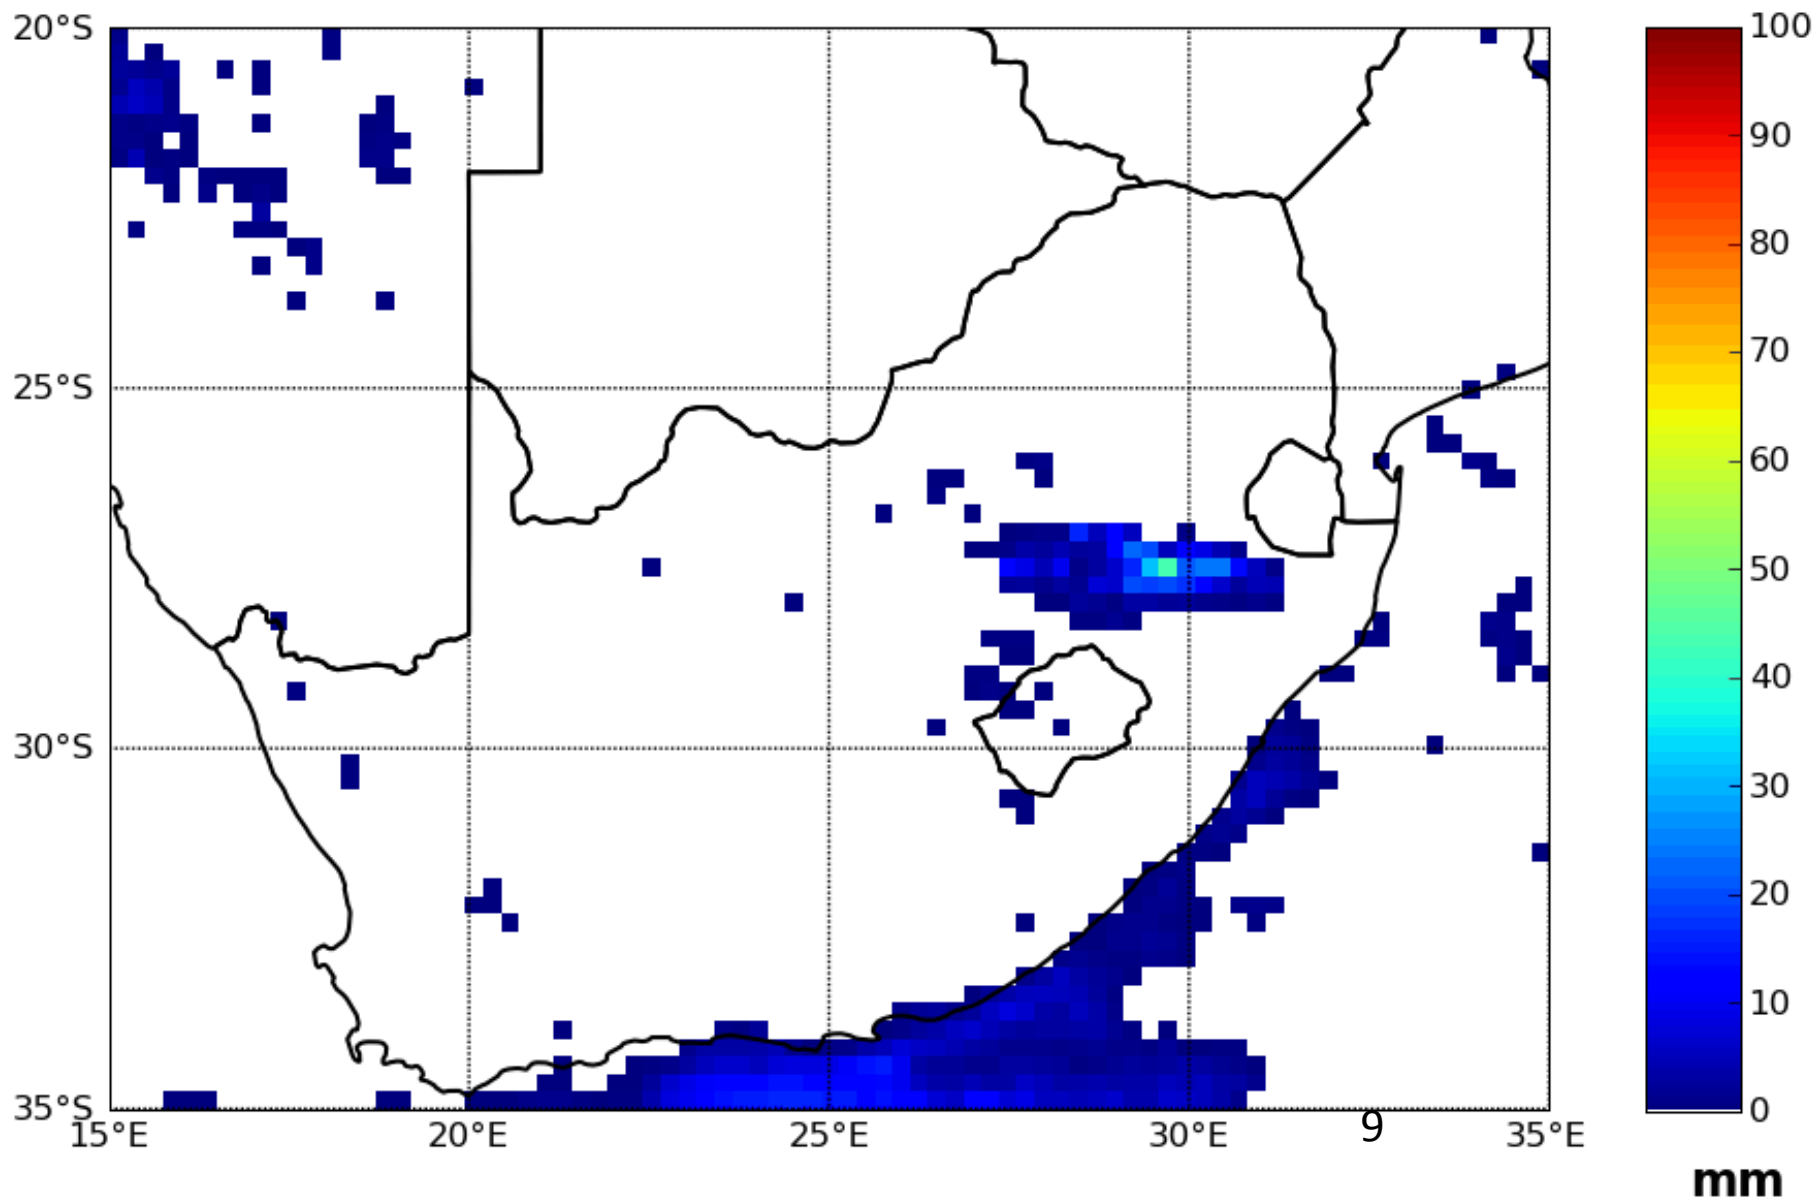

How to measure rainfall - Like this?

EUMETSAT'S METEOSAT

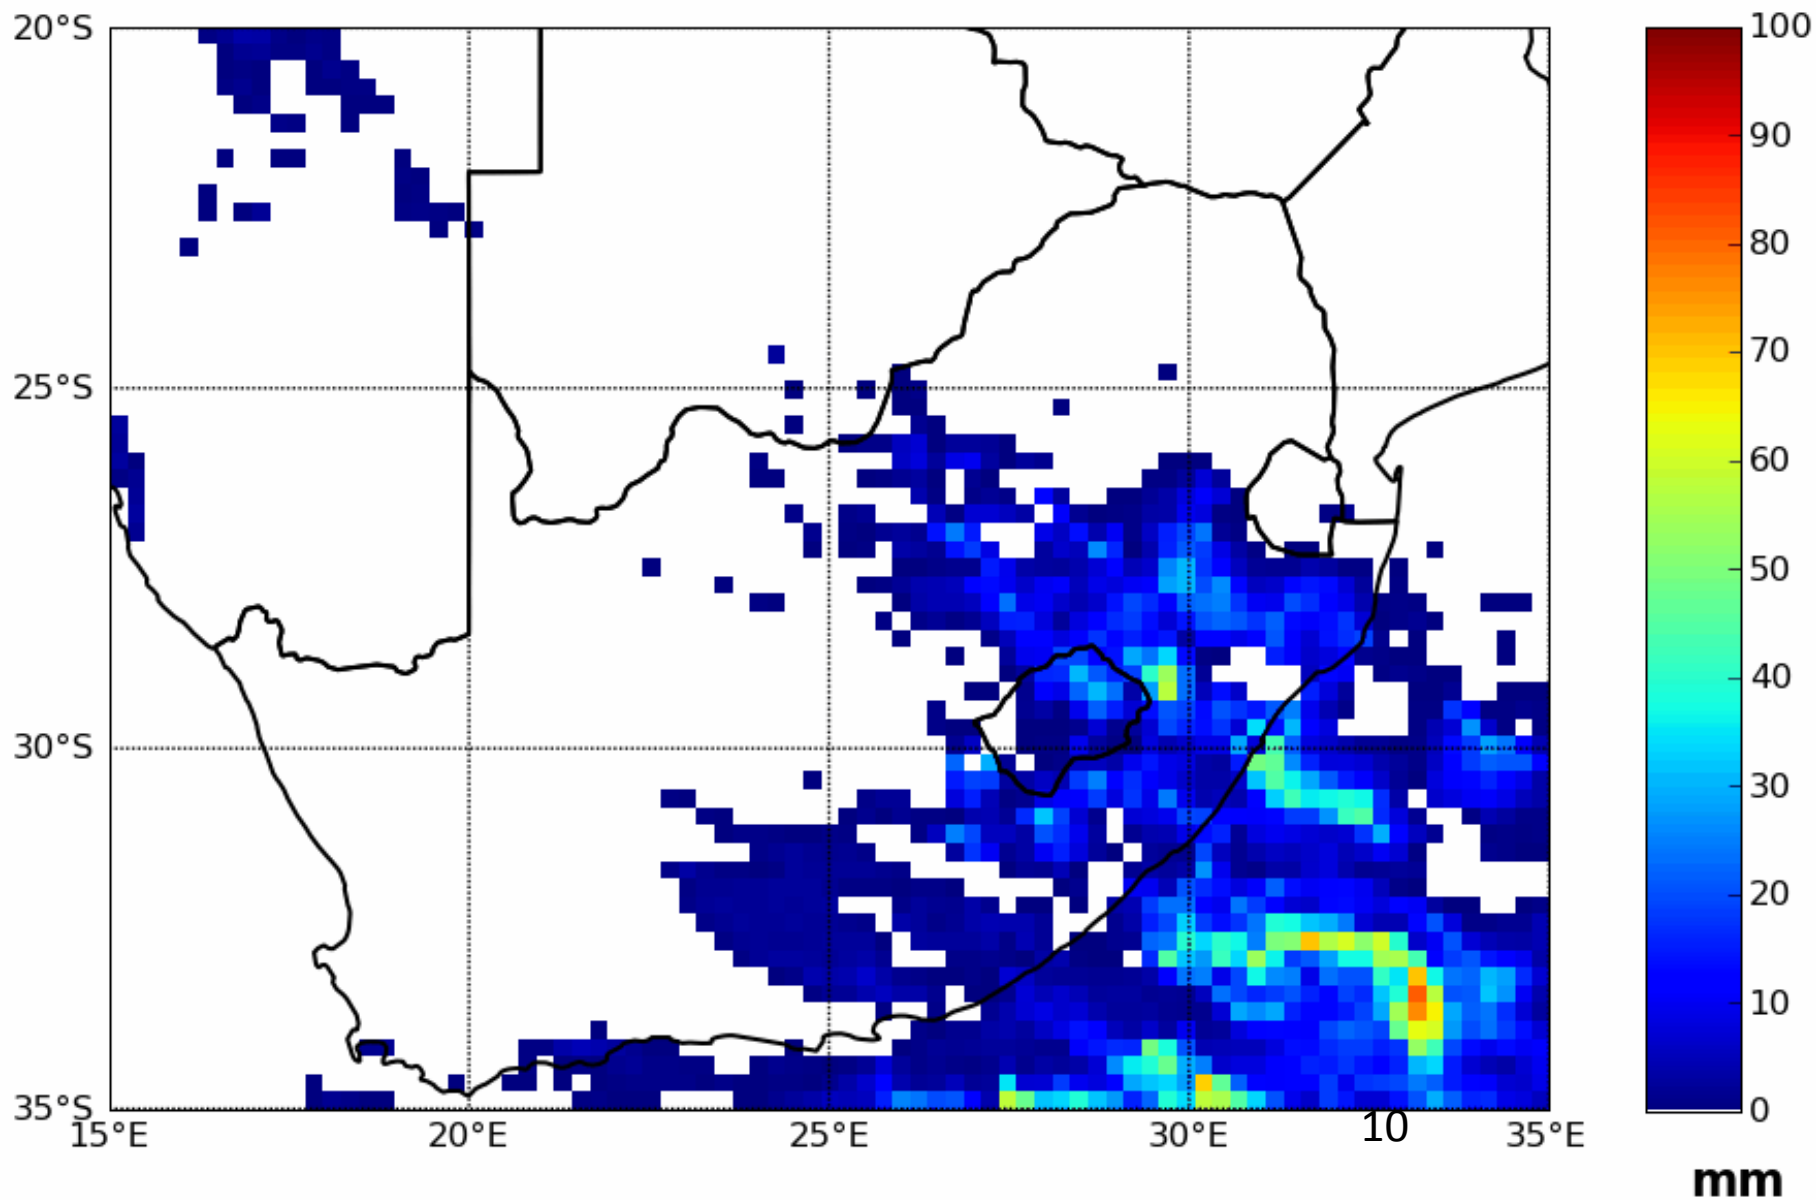

TRMM3B42RT rainfall 16/10/2008

½ scale of PRECIS

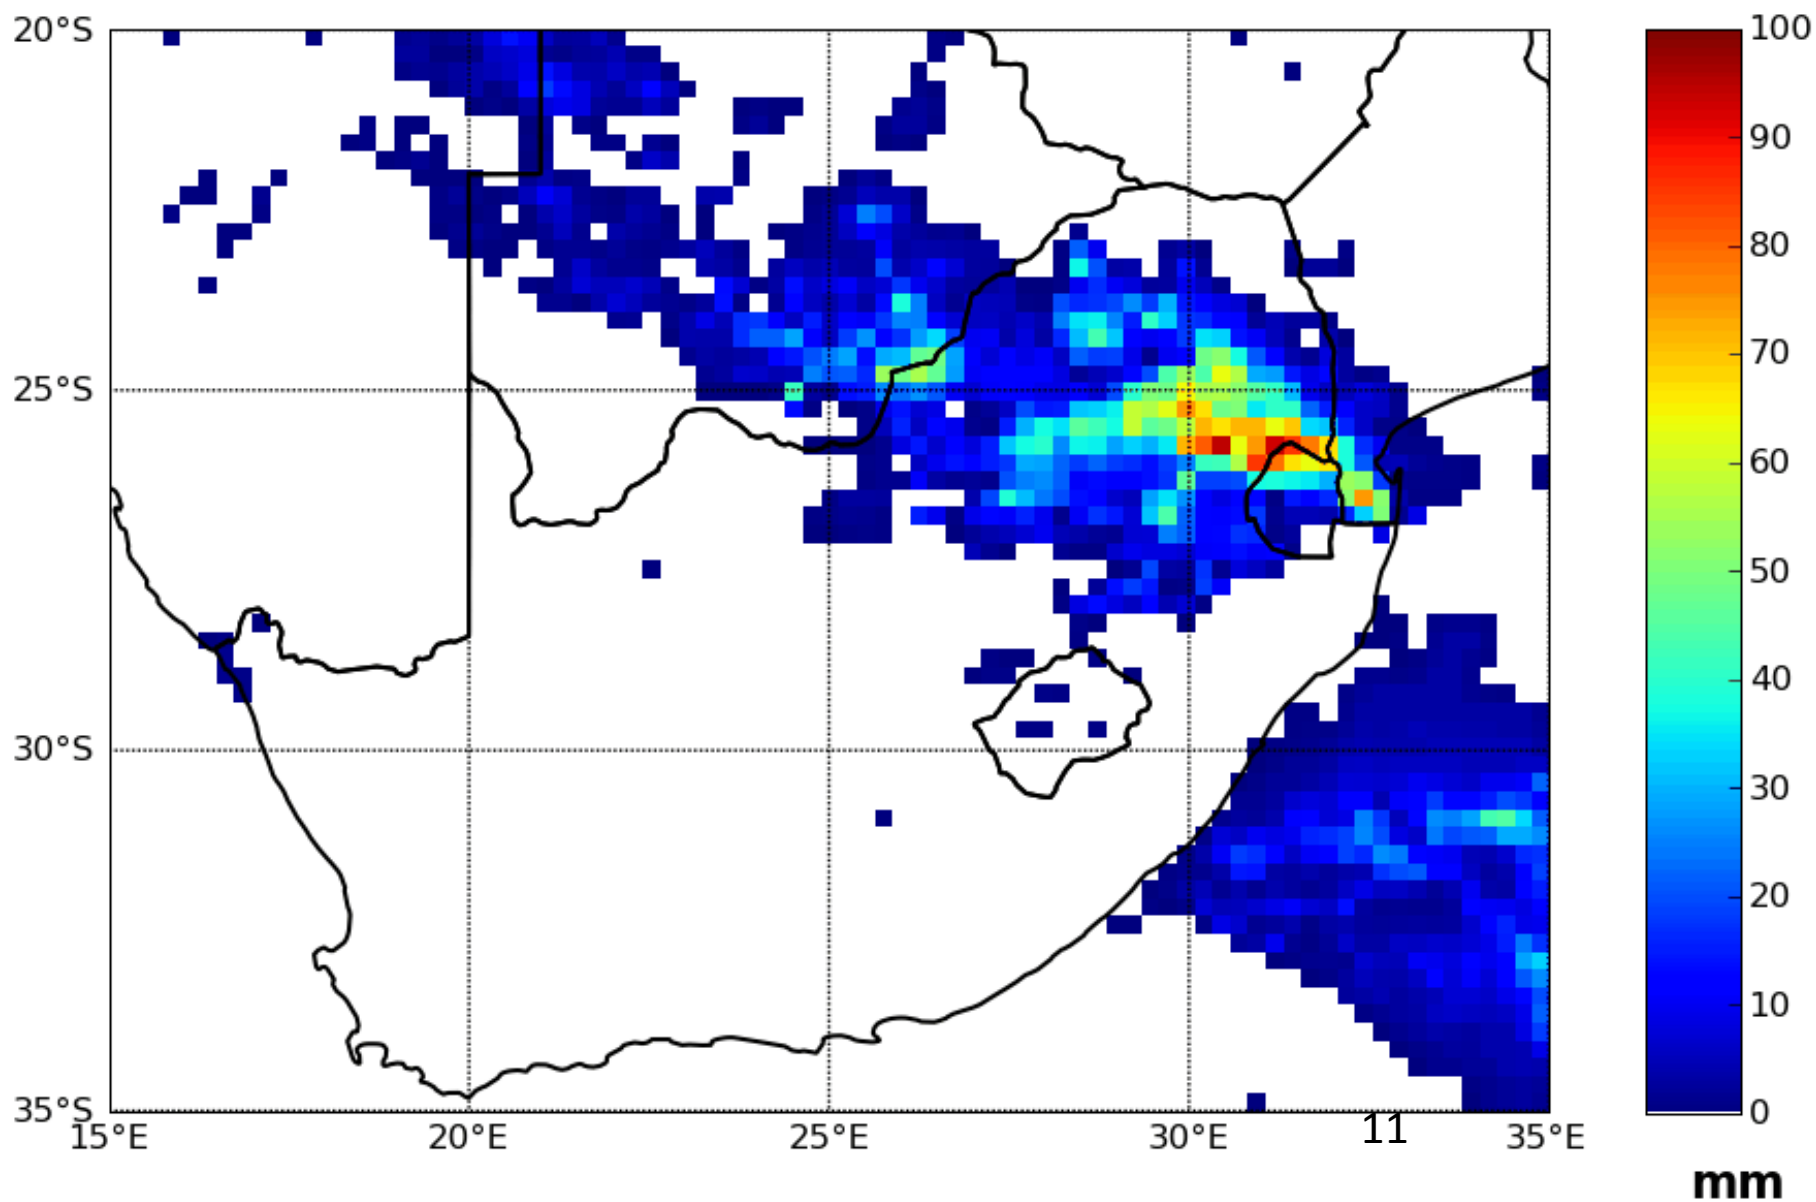

TRMM3B42RT rainfall 17/10/2008

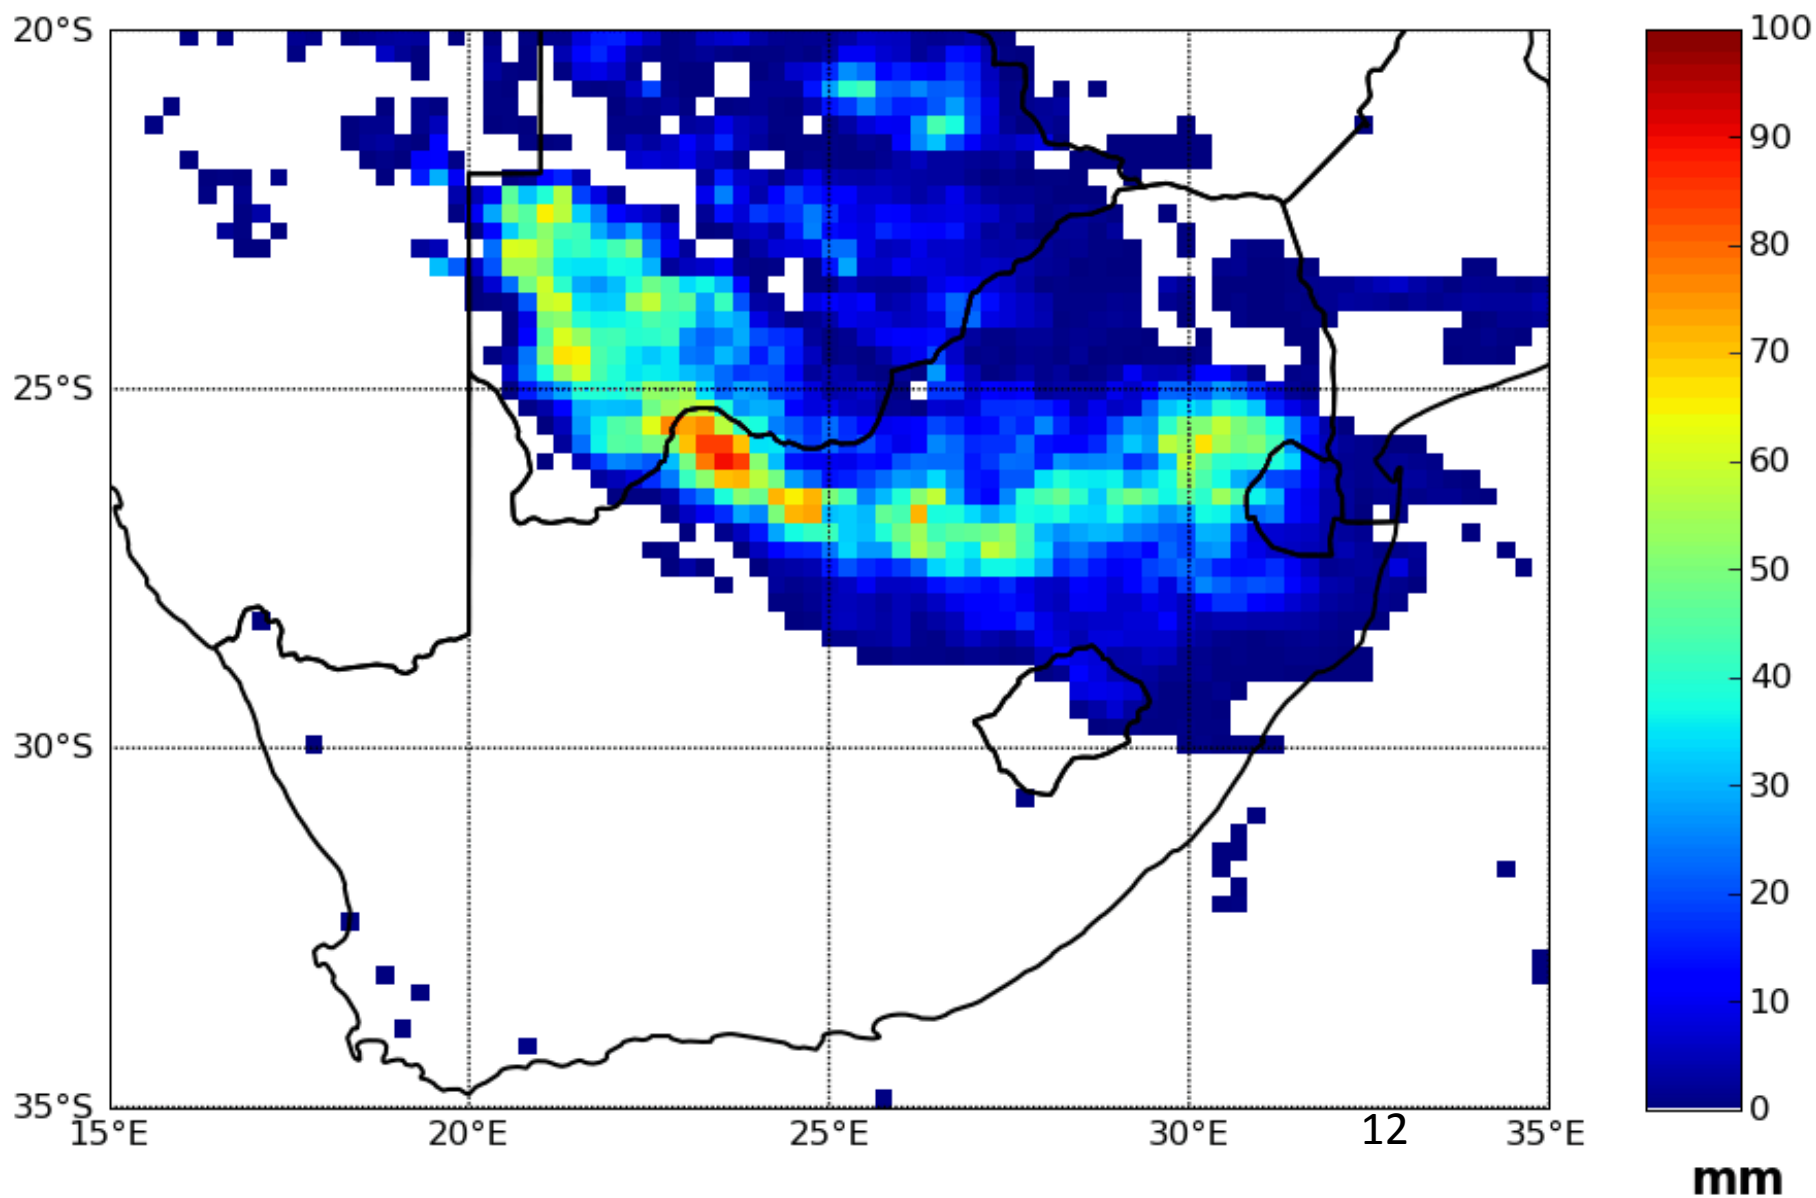

Spatial scale of
TRMM ~ 25 km

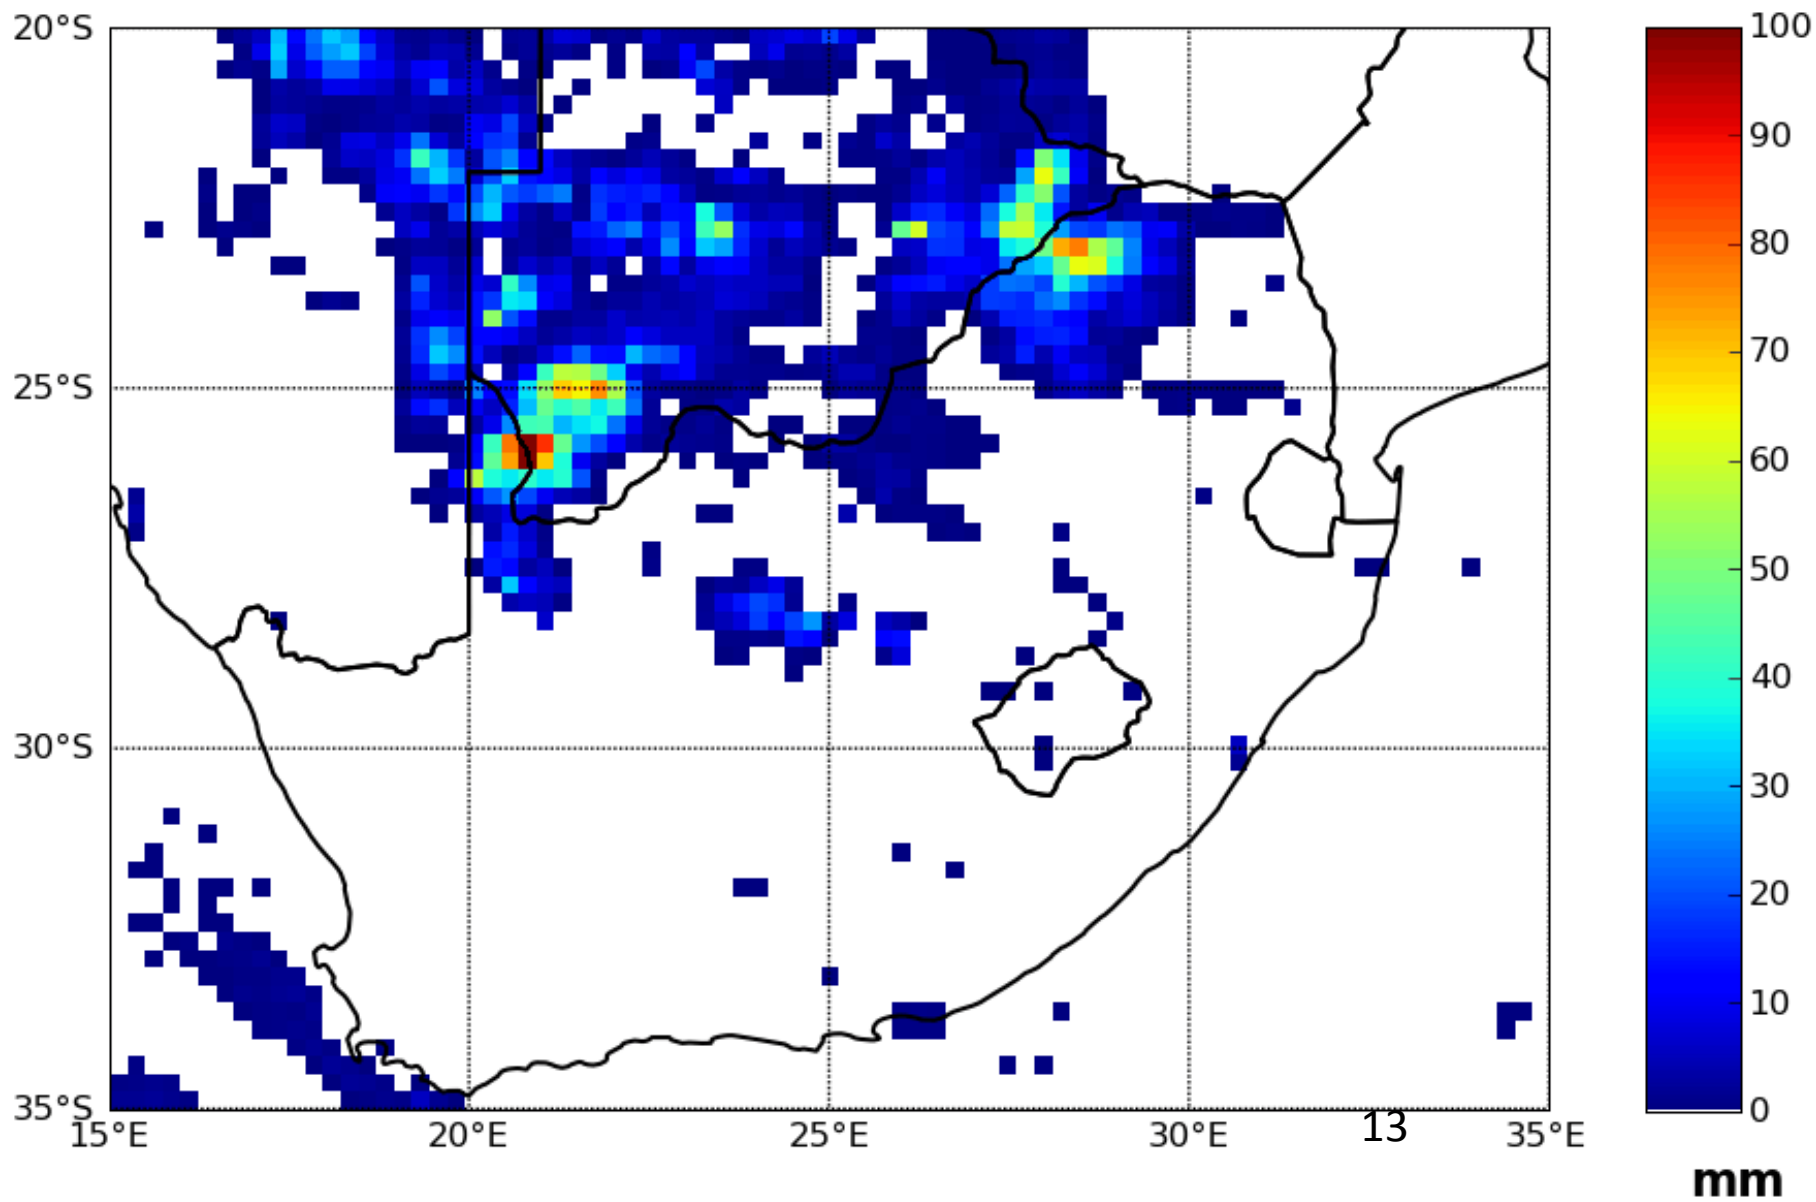

TRMM3B42RT rainfall 18/10/2008

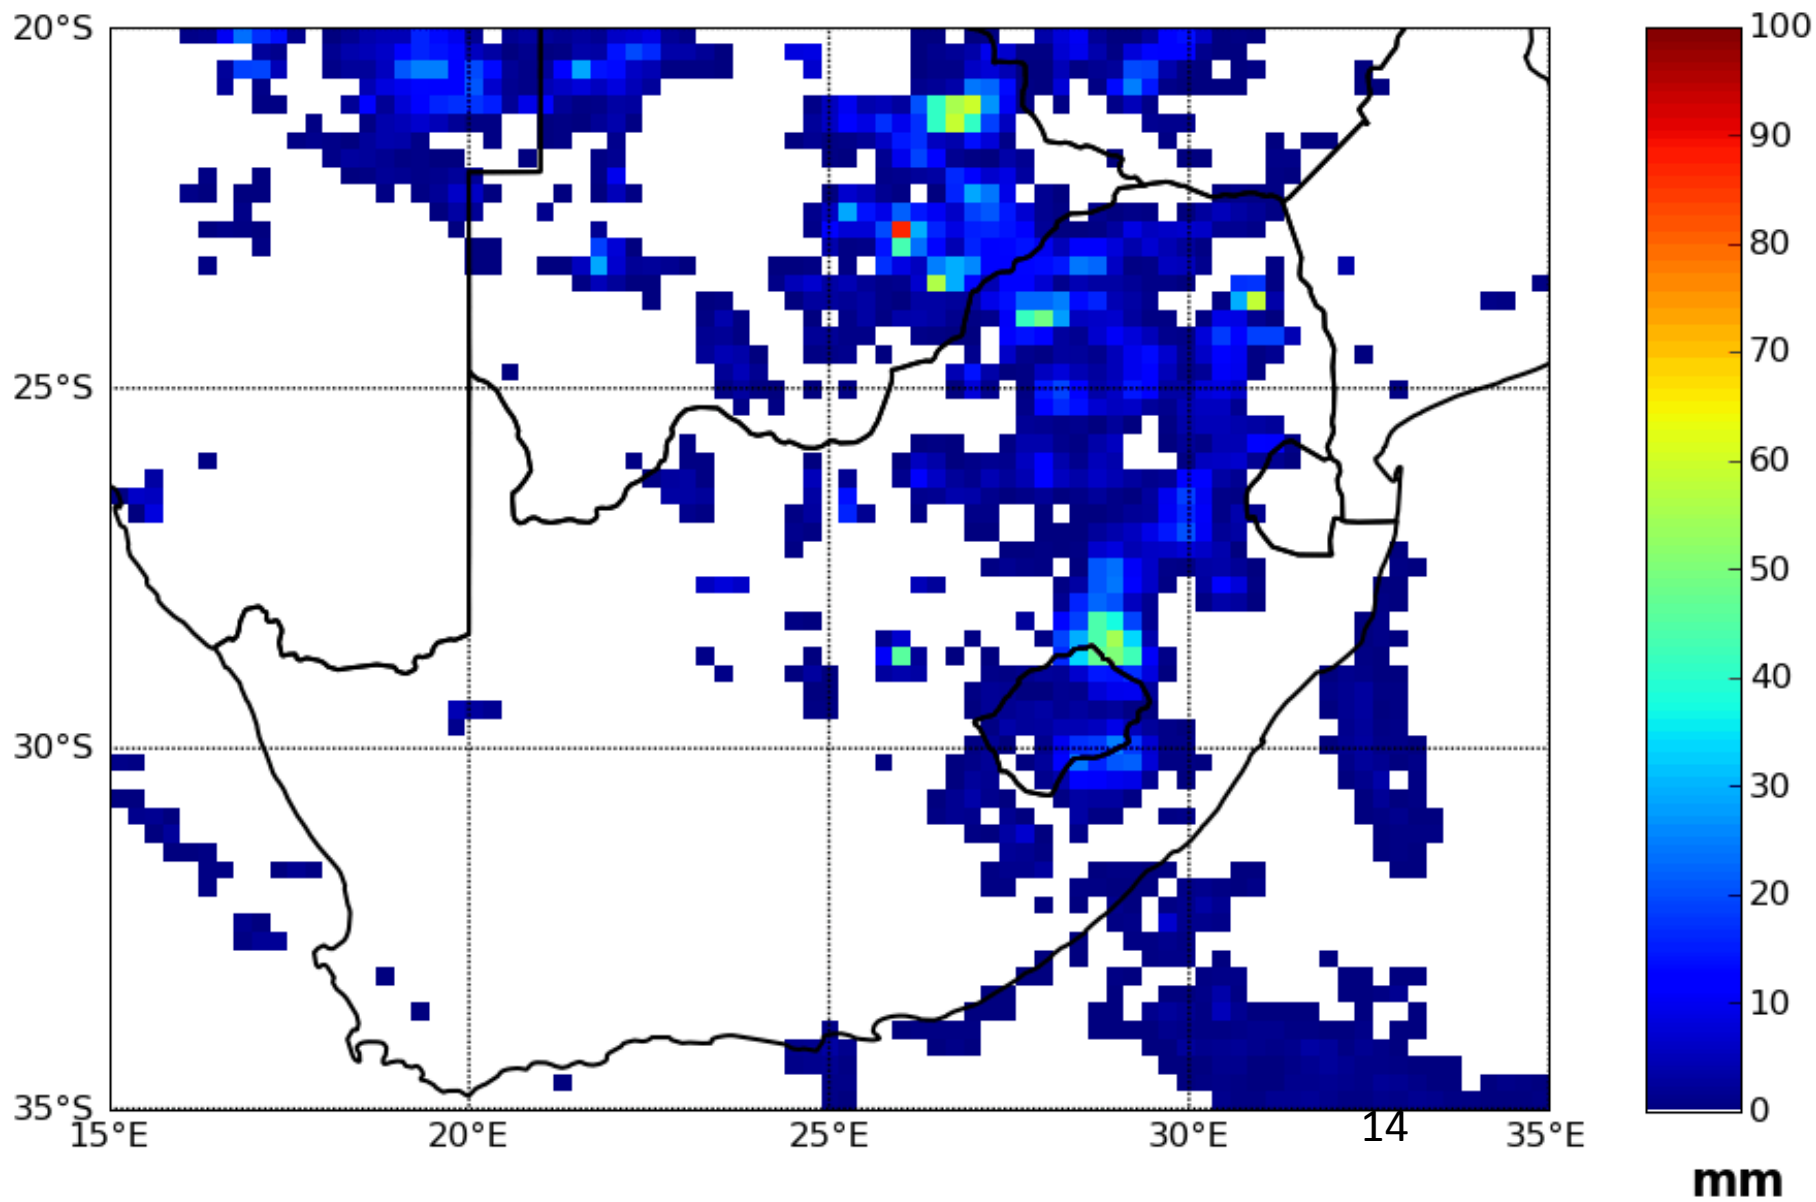

TRMM3B42RT rainfall 19/10/2008

TRMM3B42RT rainfall 20/10/2008

TRMM3B42RT rainfall 21/10/2008

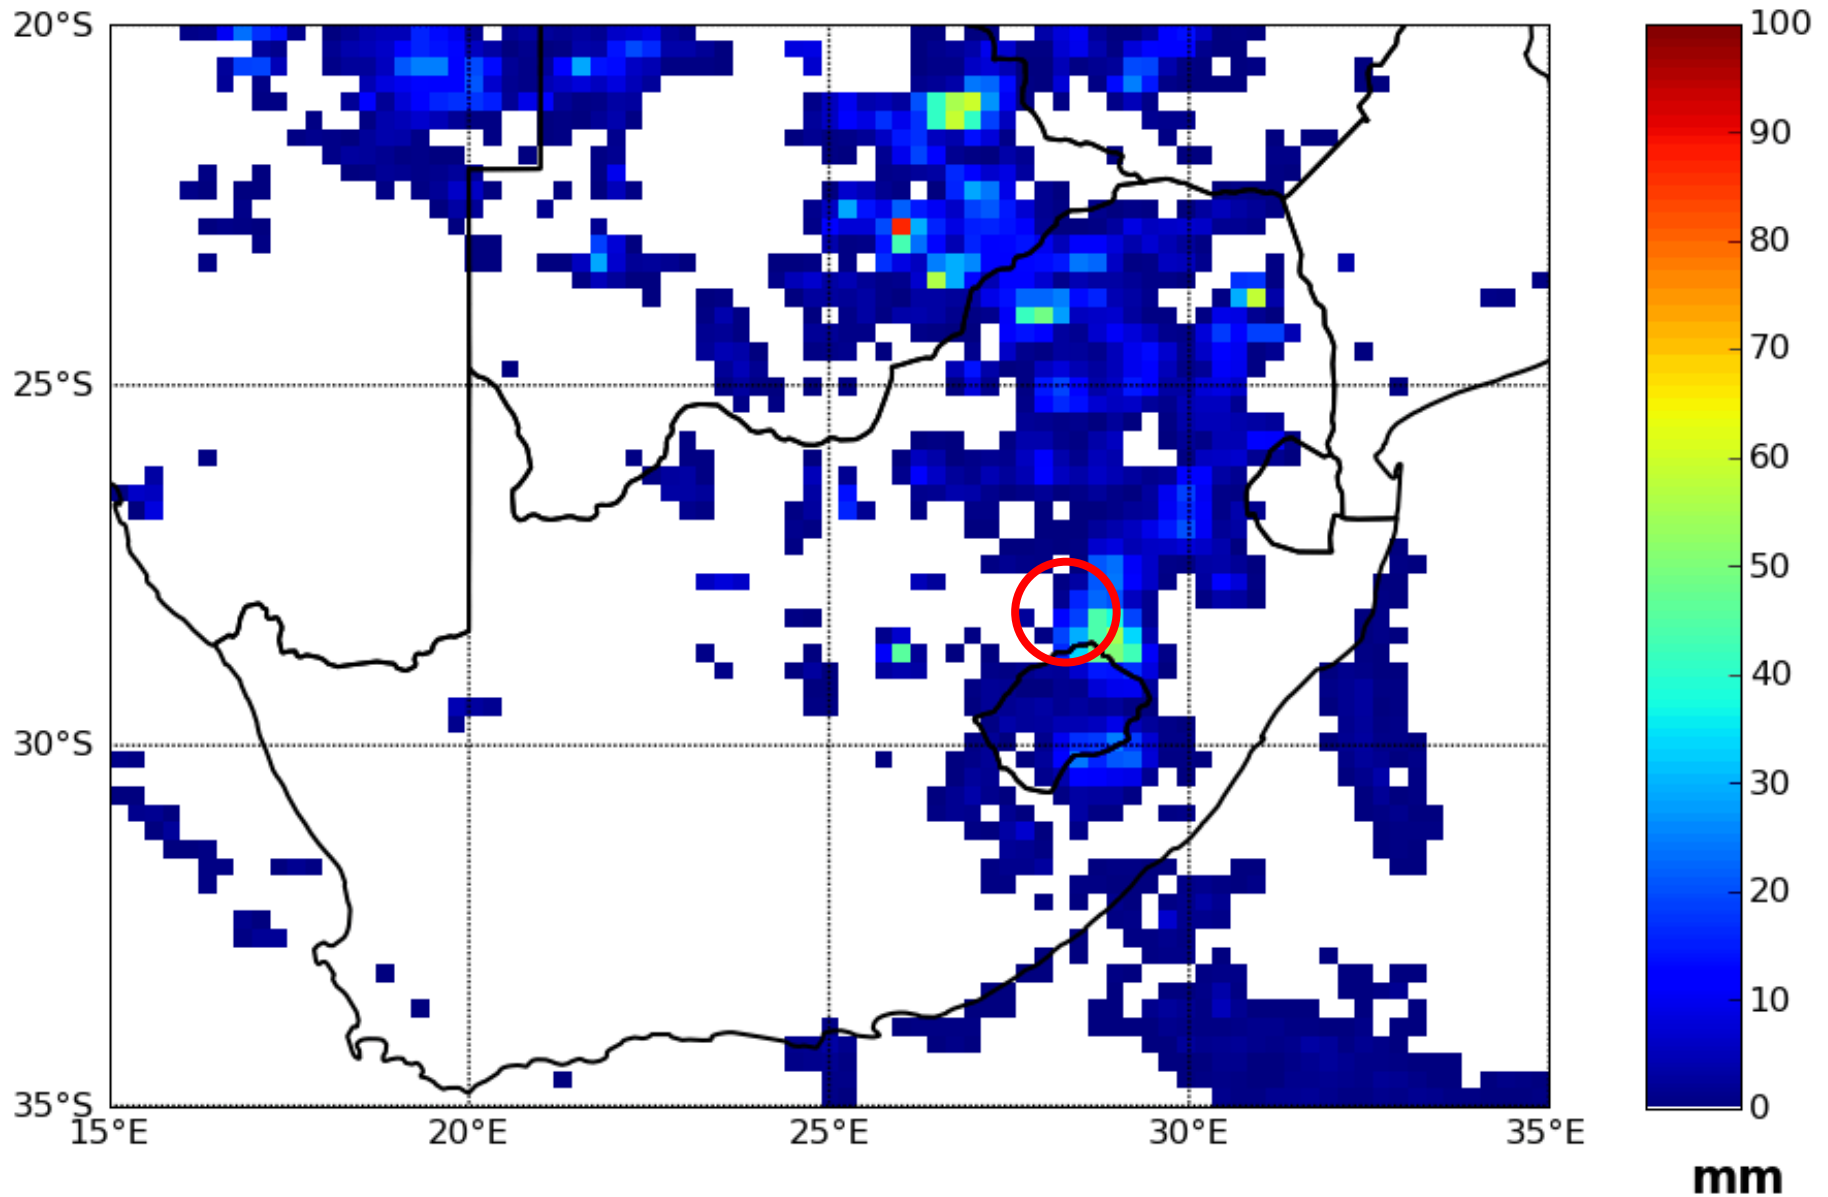

Like This? Polokwane Radar 2000

TRMM3B42RT rainfall 21/10/2008

Bethlehem radar: 128 km
diameter – 1km pixels

1998: Days 296 – 307

NOTE SPATIAL STRUCTURE & DEPENDENCE

Or like this? - yeah – it's basic

127 mm Standard Raingauge

Tipping Bucket Raingauge (TBR)

What drives our weather?

Pressure, Temperature & Spin

Model rainfall with GCMs: needs bias correction of **amounts** & **spatial dependence**

Climate Models circa early 1990s

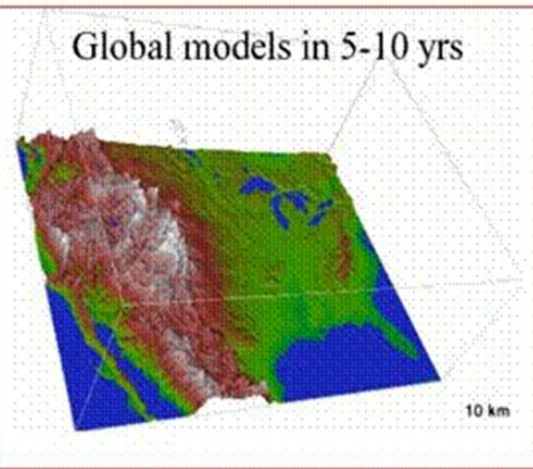

Global coupled climate models in 2006

Regional models

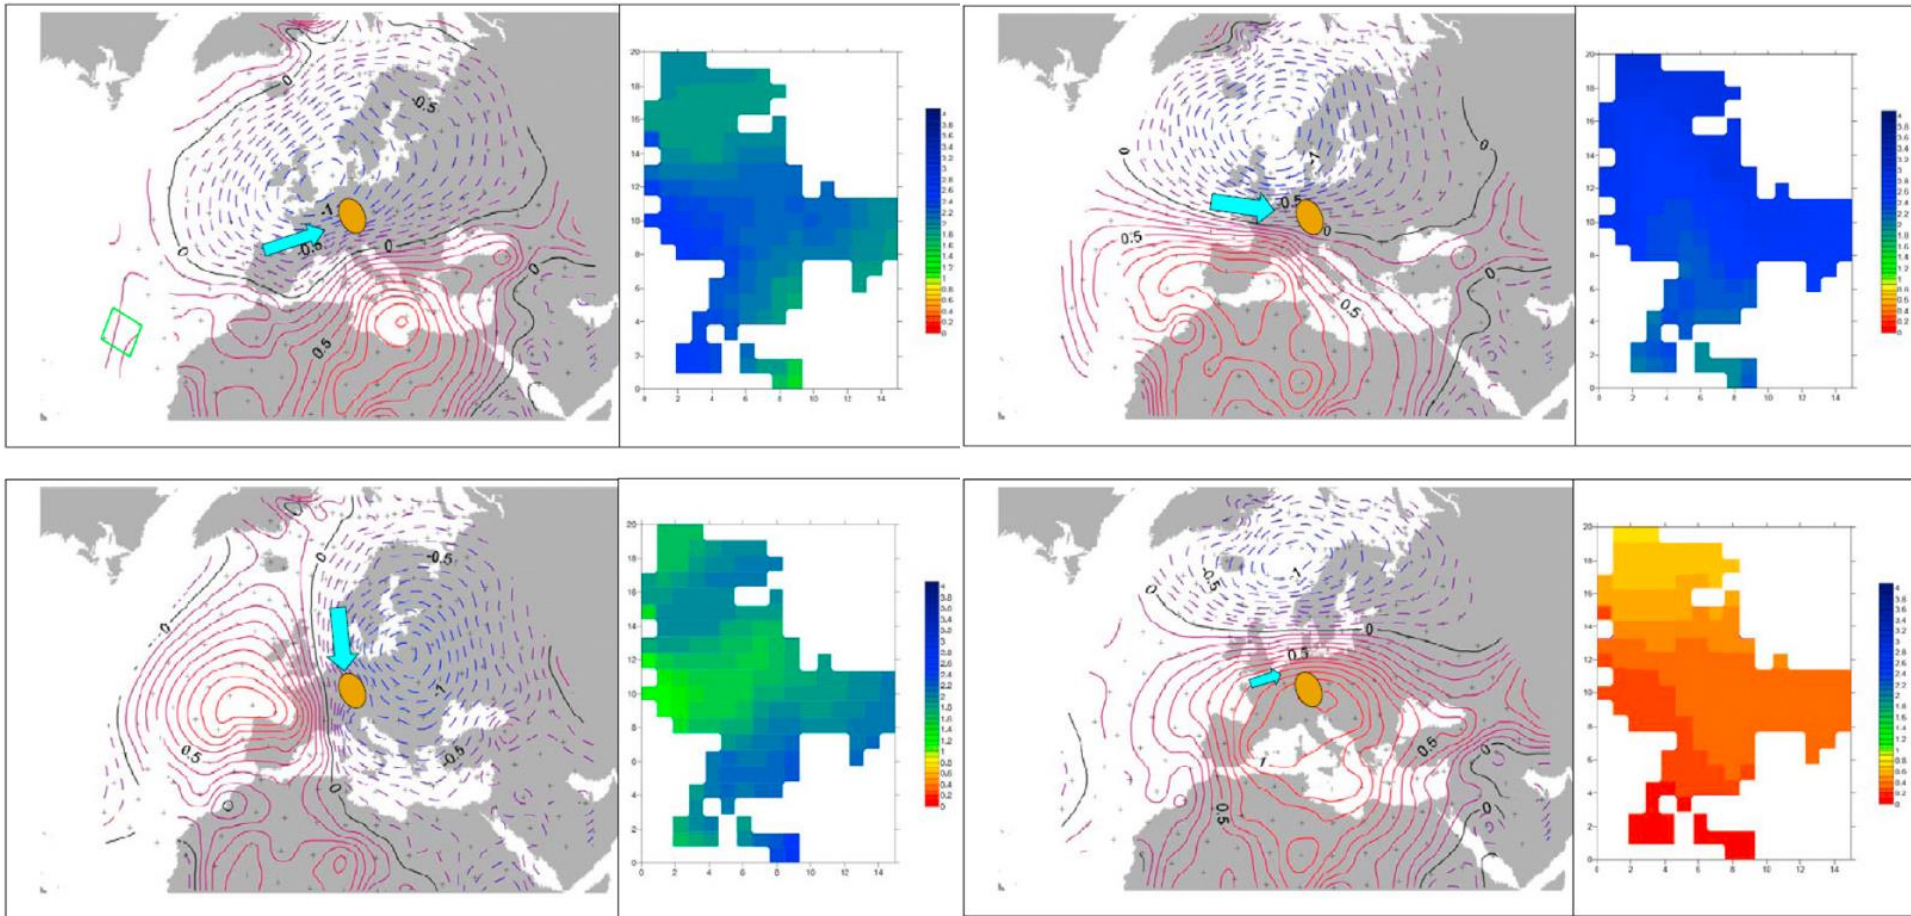

Global models in 5-10 yrs

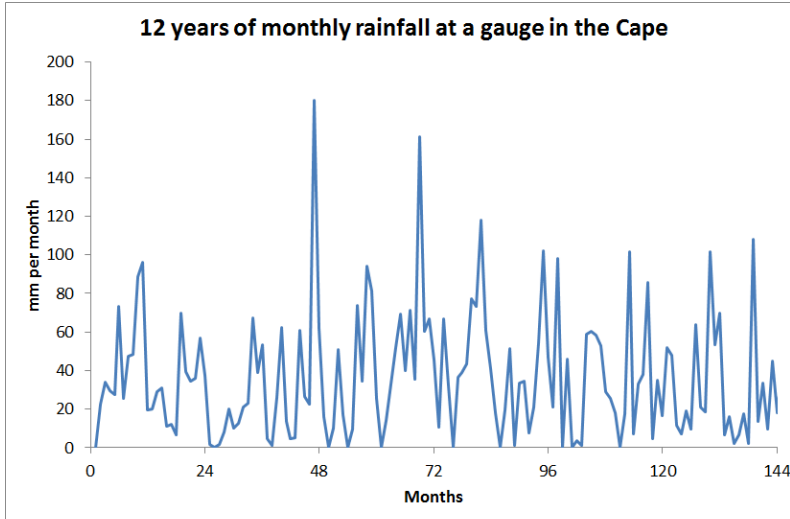

Optimistic view on model-development

We use selected circulation patterns linked to rainfall – e.g. Rhine basin [107 500 km²]

See: Bardossy & Pegram (2011) Water Resources Research

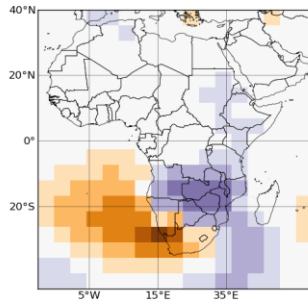

Tools: (1) time series to fdf [e.g. monthly]

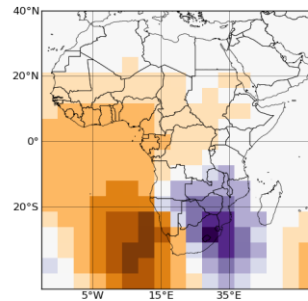

Tools (2): CP anomalies

e.g. 10 in the Cape region

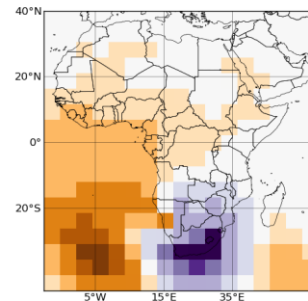

Sea level pressure anomalies - CP01

Sea level pressure anomalies - CP02

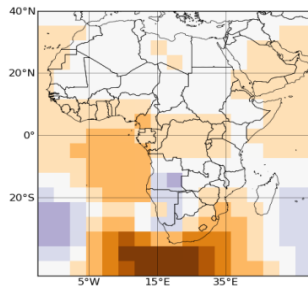

Sea level pressure anomalies - CP03

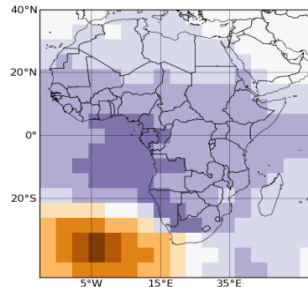

Sea level pressure anomalies - CP04

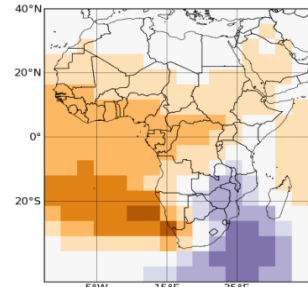

Sea level pressure anomalies - CP05

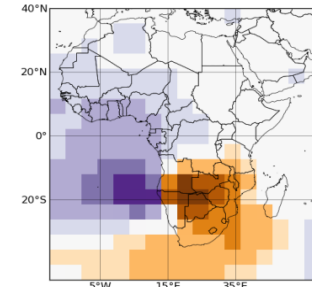

Sea level pressure anomalies - CP06

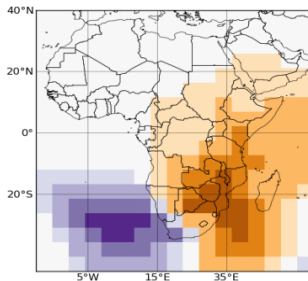

Sea level pressure anomalies - CP07

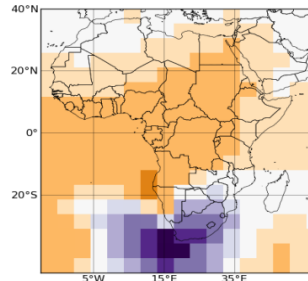

Sea level pressure anomalies - CP08

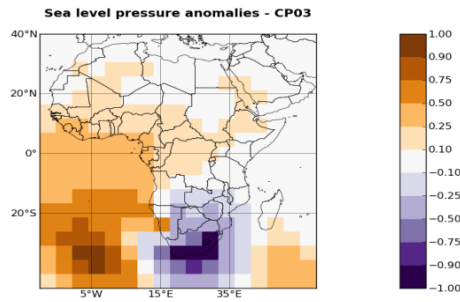

Sea level pressure anomalies - CP09

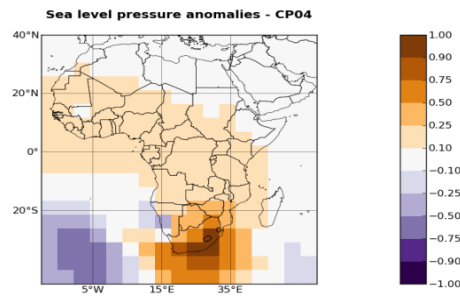

Sea level pressure anomalies - CP10

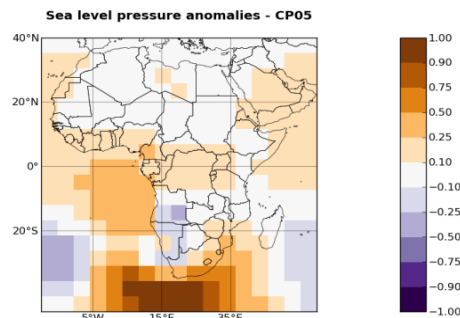

Link CP to rainfall types [daily]

16%

19%

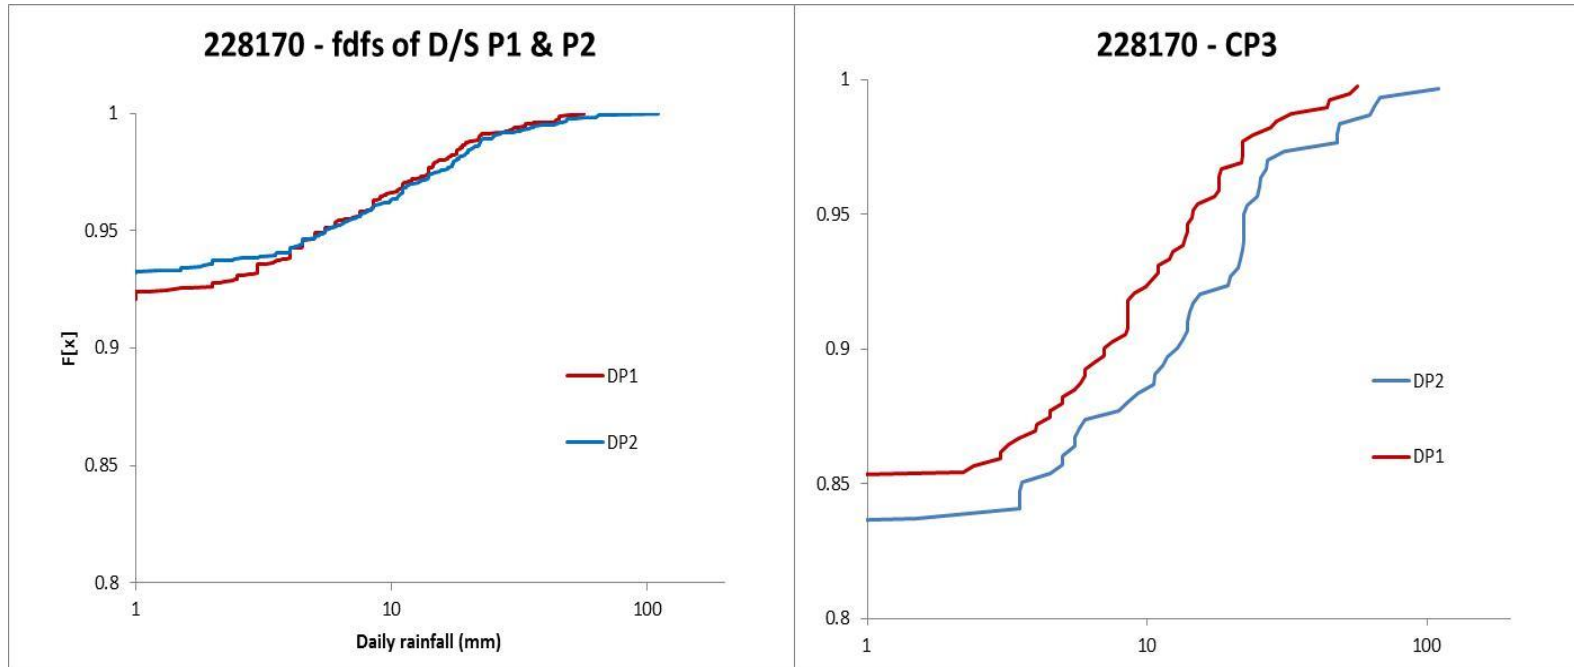

2%

Annual & CP3-based fdf comparisons for raw PRECIS1 & 2

Annual & CP3-based fdf comparisons for downscaled PRECIS1 & 2 to a gauge

Summary

We can downscale RCM blocked rainfall to the gauge scale

We can recorrelate the downscaled to capture the observed spatial dependence [not shown here]

We can preserve the shift [delta] at the same time remove the bias

We are ready to help hydrologists to perform simulations to get a handle on uncertainty

See: **WRC report K5/1964 &**
