

Water LCA: The impact of energy in SA water infrastructure

Chris Buckley
Elena Friedrich
Harro von Blottnitz

August 2011

Overview

- 💧 what is an Environmental Life Cycle Assessment?
- 💧 applicability of LCA results
- 💧 comparison of two water production processes
- 💧 inclusion of wastewater treatment and water recycling
- 💧 inclusion of salinity
- 💧 application to a power station
- 💧 waste burden shifting
- 💧 lessons
- 💧 gaps
- 💧 way forward

Environmental Life Cycle Assessment - Definition

LCA is a technique for assessing the environmental aspects and potential impacts associated with a product by:

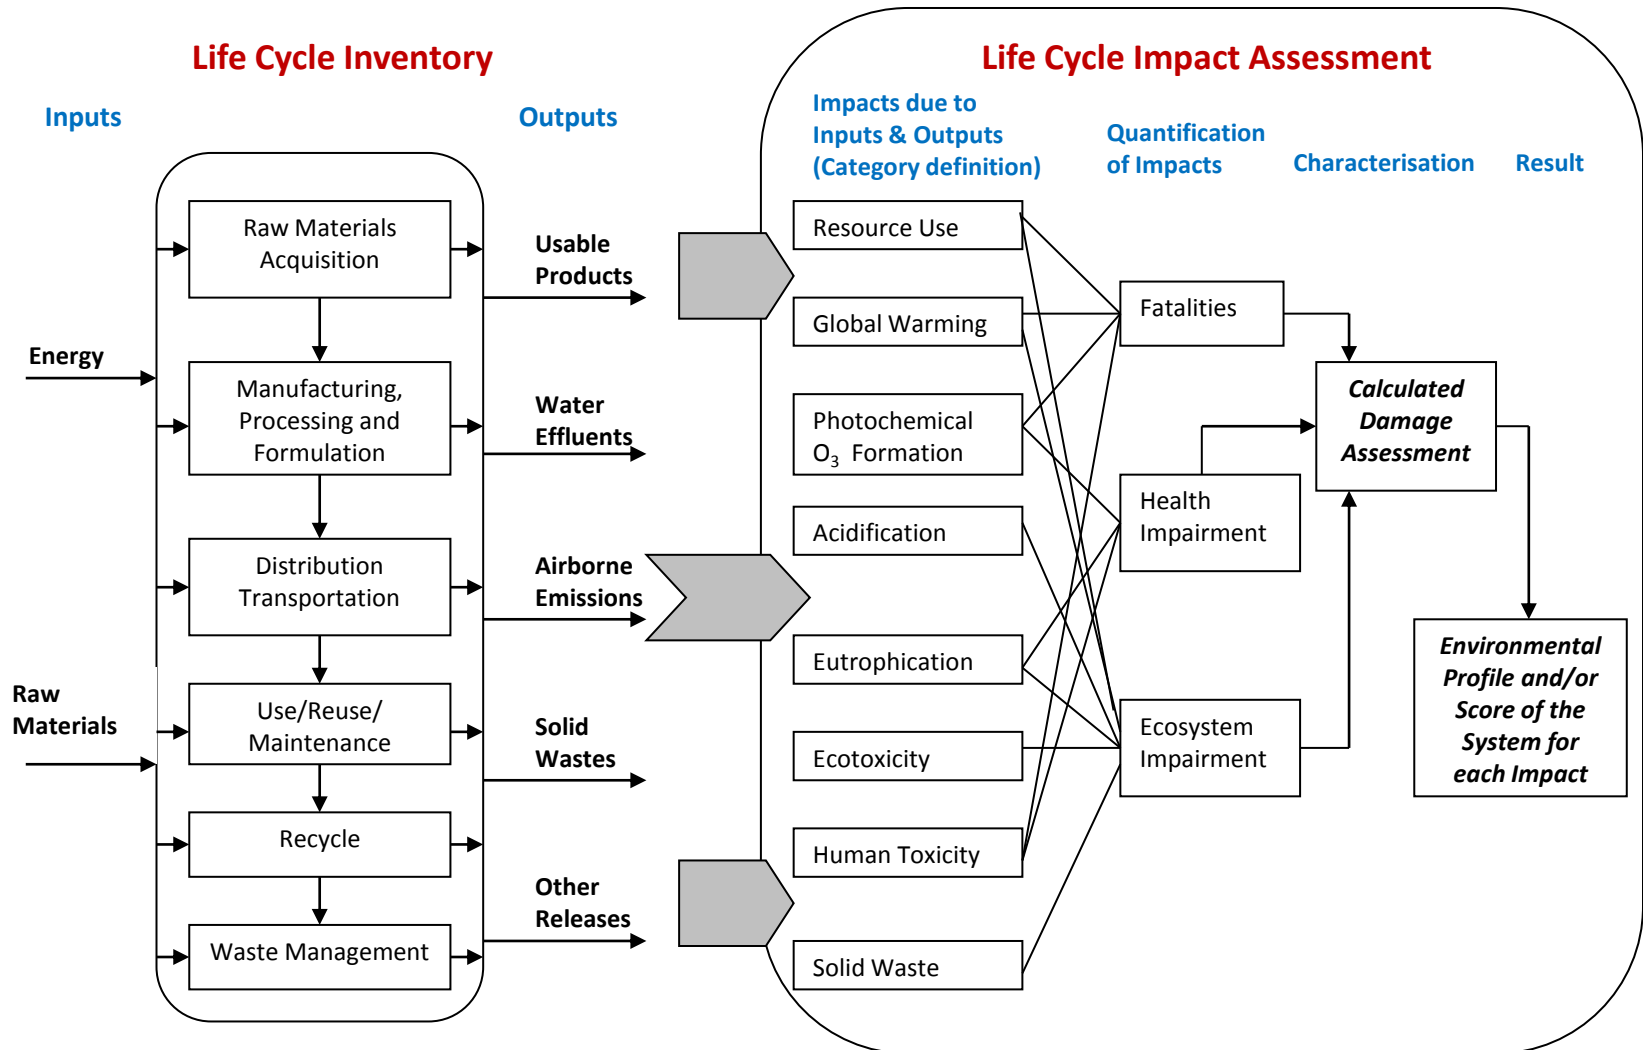

- 💧 compiling an **inventory** of inputs and outputs of a system;
- 💧 evaluating **the impacts** associated with those inputs and outputs;
- 💧 **interpreting** the results in relation to the objectives of the study

LCA studies the environmental aspects and potential impacts throughout a product's life (i.e. **cradle-to-grave**) from raw material acquisition through production, use and disposal. The general categories of environmental impacts needing consideration include **resource use**, **human health** and **ecological consequences**.

SABS and ISO 14040 standard (1997)

Life Cycle Assessment: an overview

Source: modified from SETAC, 1997 and Wenzel et al., 1997

General Applicability

- 💧 environmental profile generation
- 💧 design for the environment
- 💧 product development and improvement
- 💧 eco-labelling and environmental claims
- 💧 marketing and strategic planning
- 💧 environmental reporting
- 💧 waste minimisation support
- 💧 EIA and SEA support
- 💧 ISO 14001 EMS support

Production of Potable Water – Umgeni Wiggins Water Treatment Plant

Goal and scope

- 💧 generate environmental information on two water treatment processes
- 💧 identify improvement potential for processes
- 💧 compare environmental burdens of **conventional** and **membrane** treatment methods

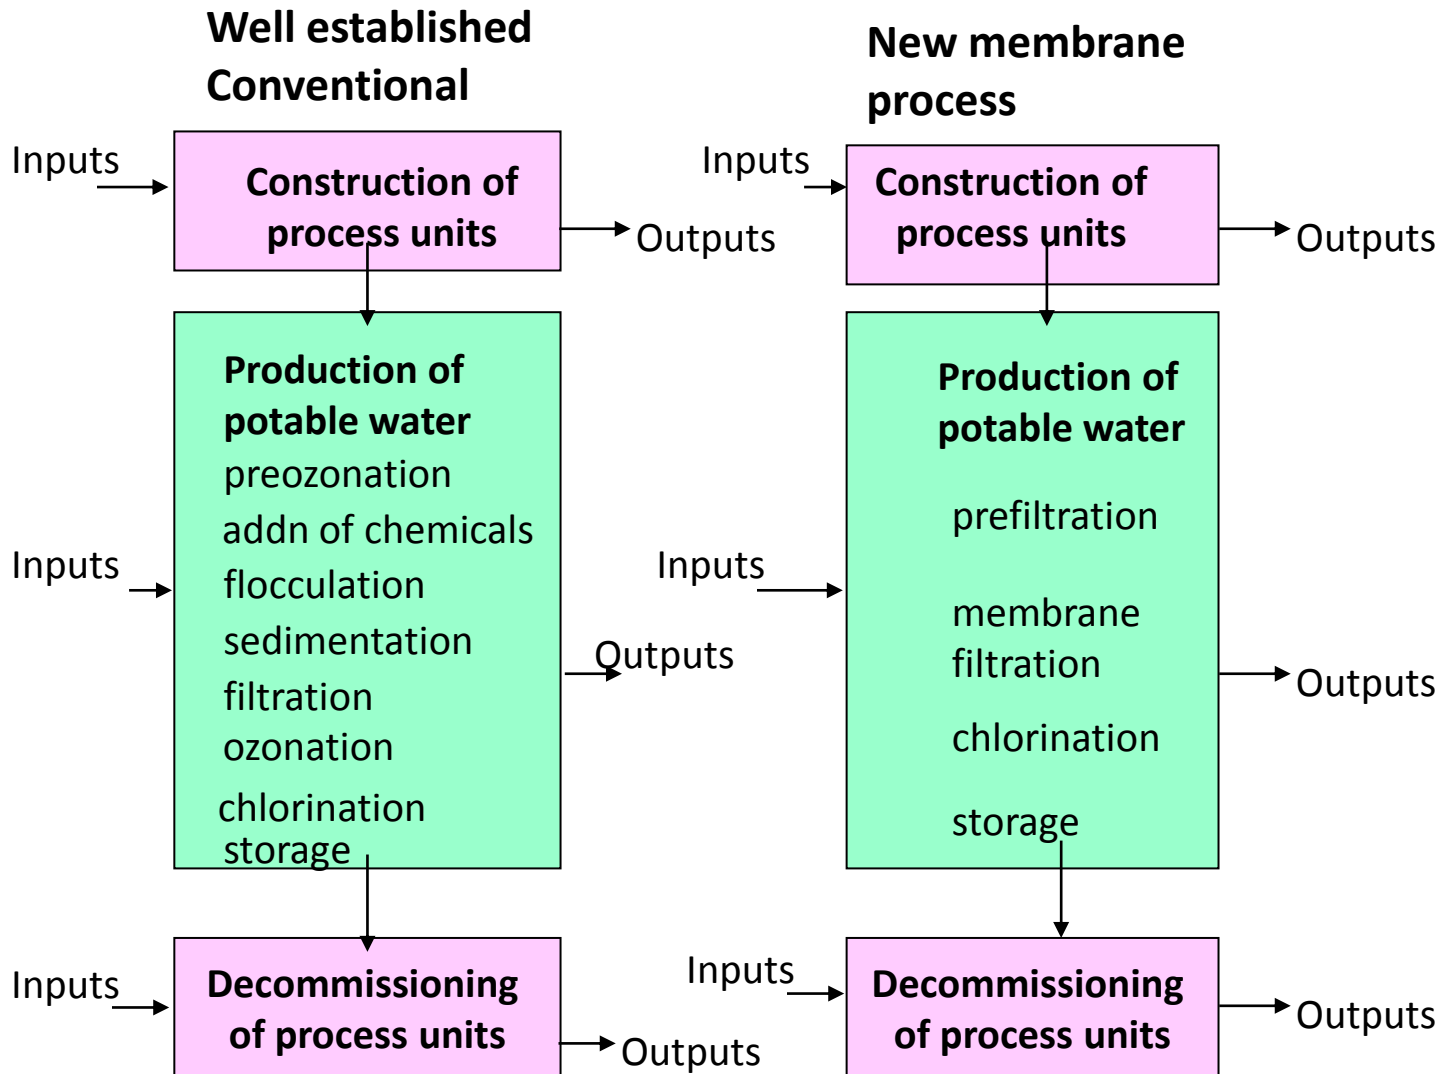

Functional unit

- 💧 1 000 kg water at the quality stipulated by Umgeni Water

Conventional and New Membrane Water Treatment Processes

Comparison of Environmental profiles

Category	Conventional	%*	Membrane	%*	Units
global warming	1.8E-1	94	2.9E-1	99	kg CO ₂ -Equiv
ozone depletion	3.6E-9	89	9.5E-10	88	kg R11-Equiv.
acidification	1.2E-3	93	1.8E-3	98	kg SO ₂ -Equiv.
Nutrient enrichment	7.3E-5	89	5.7E-5	97	kg PO ₄ – Equiv
photochemical	1.5E-5	84	4.9E-6	83	kg Ethene-Equiv
aquatic ecotoxicity	2.7E-3	98	2.1E-4	92	kg DCB-Equiv.
human toxicity	4.1E-3	81	1.8E-3	89	kg DCB-Equiv.

* Percentage from the Operation Stage

Friedricks 2002

Decommission	0.0002	0.0004	0.0015	0.0036

Friedricks 2002

Summary of Results

- 💧 The most significant life stage in terms of environmental impacts is the **operation** stage
- 💧 The majority of the environmental impacts are traced to **electricity** production
- 💧 **Ozonation** and **sludge treatment** have the highest environmental burdens for the conventional technology
- 💧 **Pumping** and the **design of the plant** have the highest contribution towards environmental burdens for the membrane technology
- 💧 **The two technologies are comparable** from an environmental point of view

However the membrane process is an emerging process while the conventional process is well established

Recommendations for Water Production

💧 for environmental improvement

- 💧 increase electricity efficiency
- 💧 optimisation of ozonation (conventional method)
- 💧 efficiency of pumping and the design of the plant (membrane method)

💧 for further LCA research

- 💧 develop LCA impact categories for salination and water consumption (i.e. water shortage)
- 💧 extend the study by including more details and more areas of the water cycle

Options for the Provision of Water to 200 000 New Domestic Consumers in Durban

Option	Description
1	sweat the assets
2	recycle treated wastewater to industry
3	new construction (dam, waterworks, sewage works)

scenario A – waterborn sewage
scenario B – dry on-site sanitation

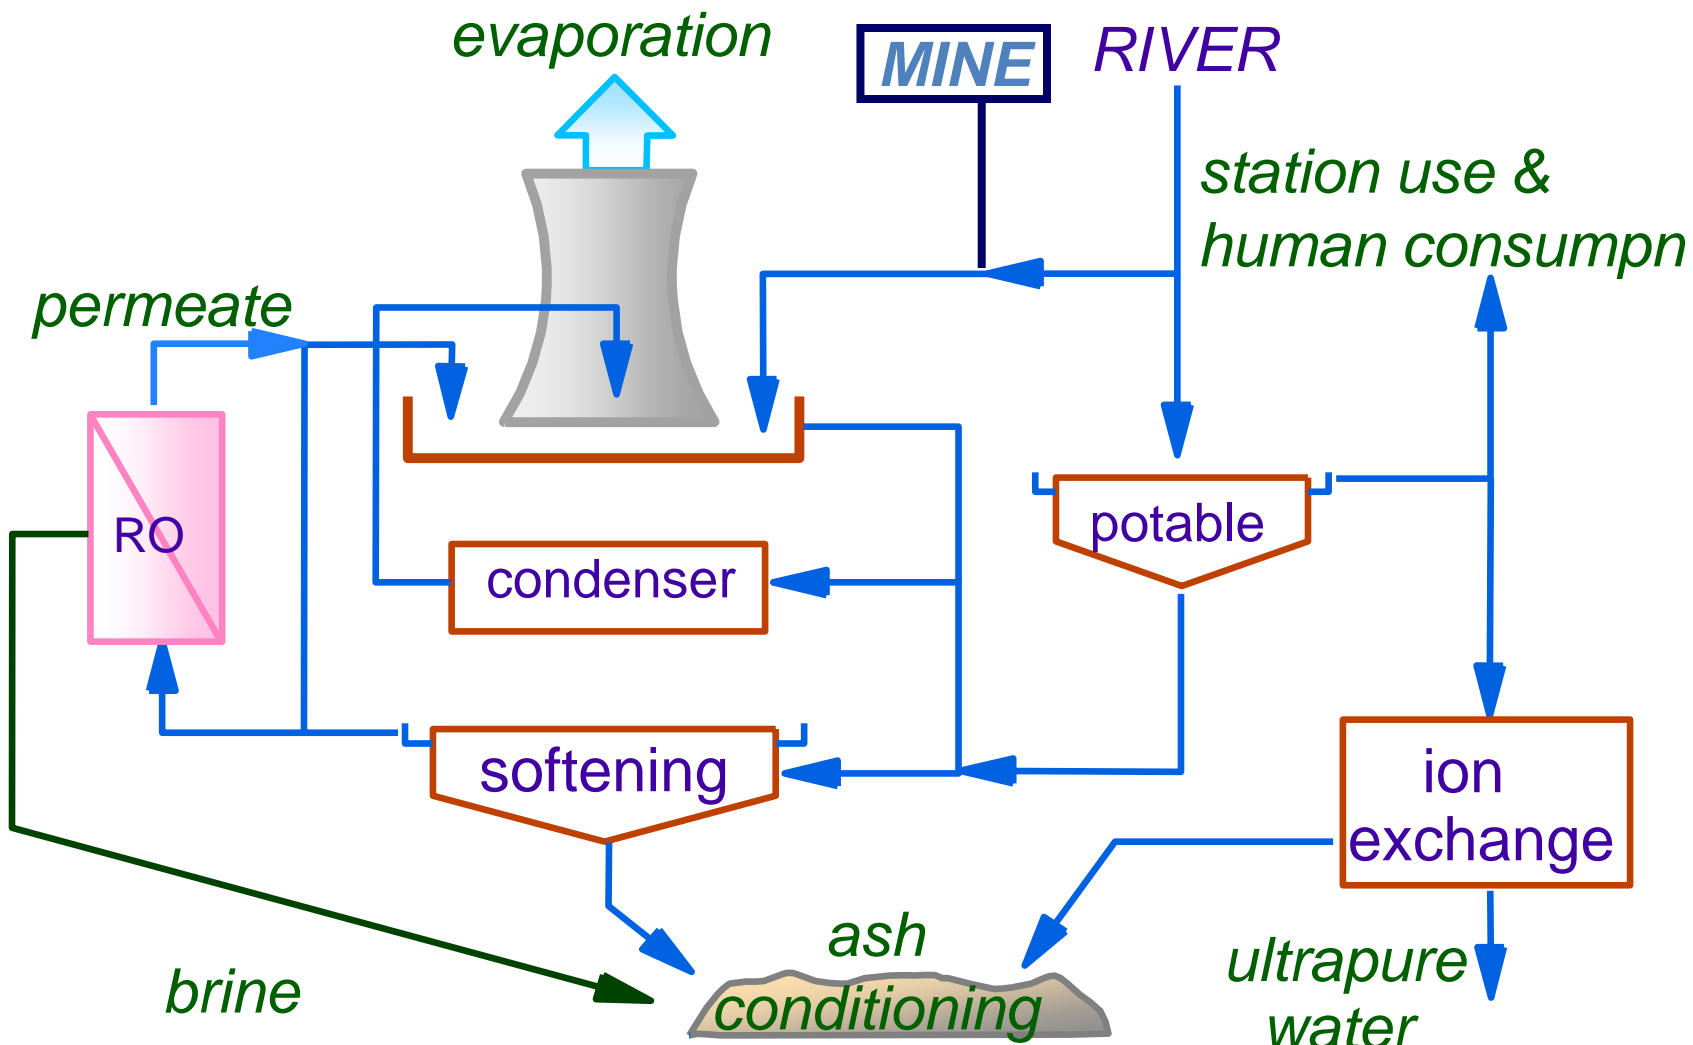

S Pillay 2006

Summary of Results (for Durban)

- 💧 **electricity** consumption per kL is a metric for **environmental burden**
- 💧 **wastewater treatment** has the highest burden (activated sludge)
- 💧 **dry on-site** sanitation has the lowest environmental burden
- 💧 **water recycling** to a lower class (industry) user is to be encouraged

Letabo Power Station

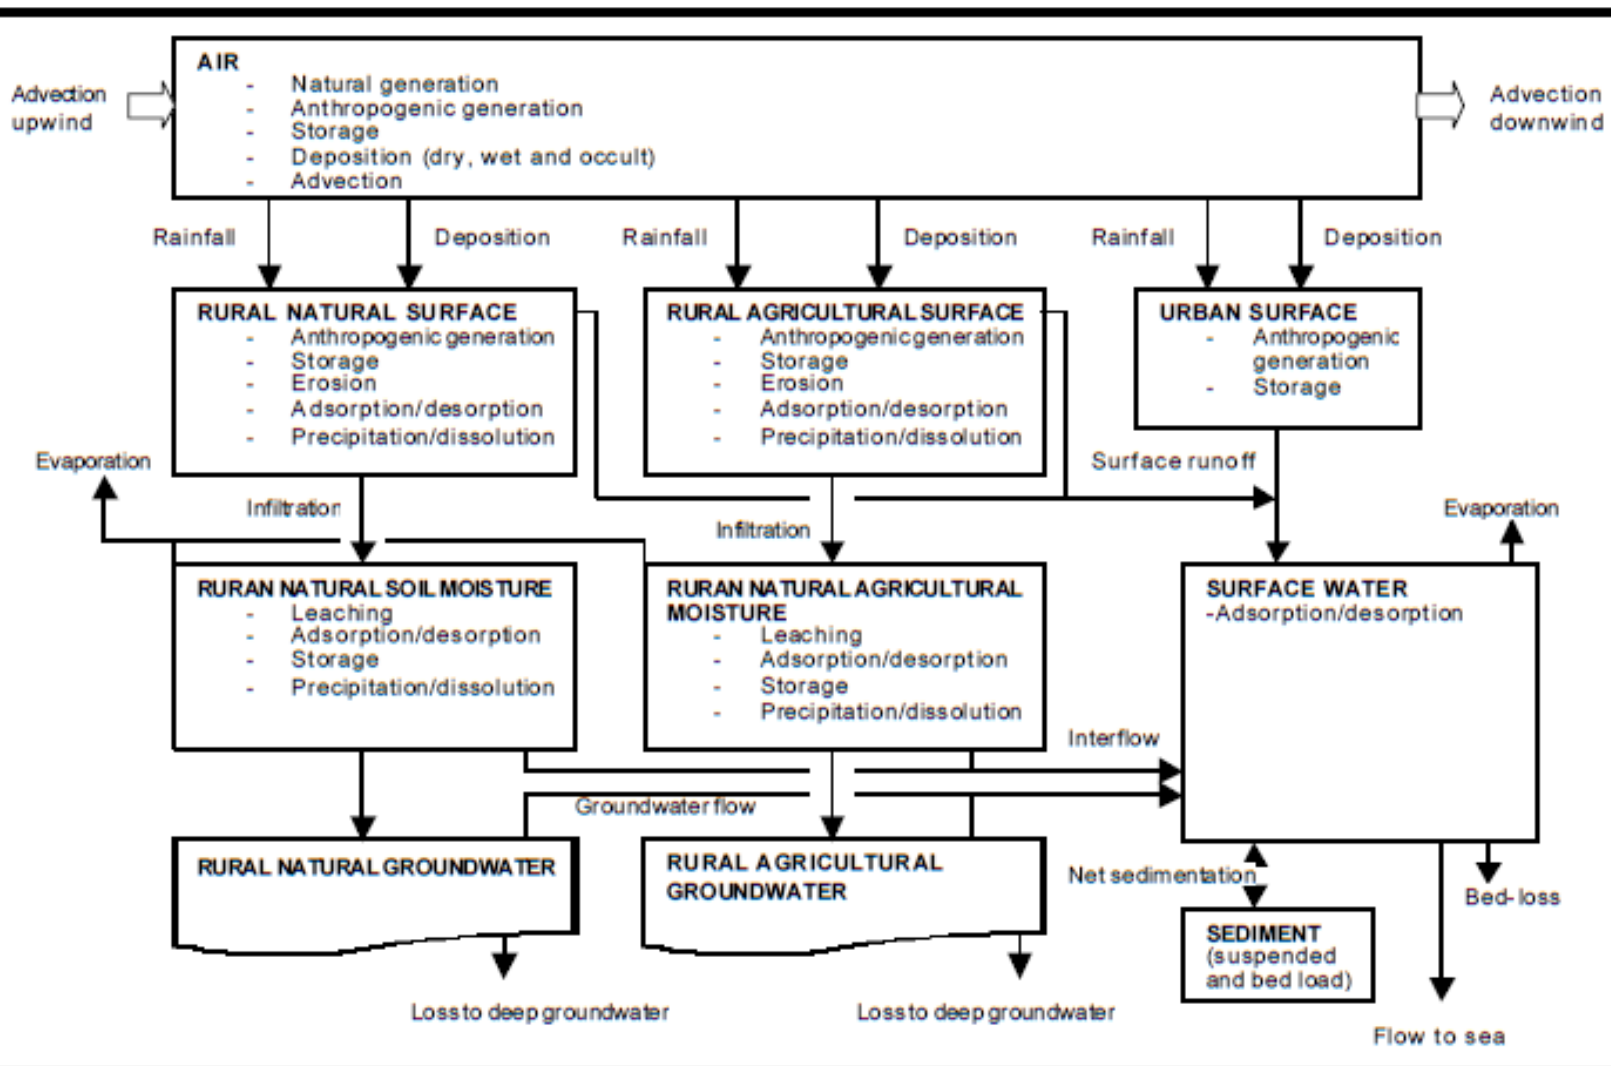

Letabo Power Station

- 💧 where to put the **salts**
- 💧 analysed using LCA thinking + water pinch
- 💧 permit was **on or off** (permit / prohibit) to discharge mine water to the river
- 💧 mine water could be used ***at a cost***
- 💧 LCA thinking guided the modelling

Conceptual Model for the Fate of Salts

A Leske 2004

Salinity Potential for Release in Different Compartments

Initial release compartment

Total salinity potential
(kg TDS equ./kg)

Atmosphere	0.013
River	0.16
Rural natural surface	0.03
Rural agricultural surface	1.00

A Leske 2004

irrigation with saline effluent is a controlled activity

Regional Analysis of Desalination

- reverse (RO) osmosis desalination using electricity **does not shift salt** from one region to another
- ion exchange (only) is preferable to RO
BUT
RO is preferable to ion exchange + flocculation

Ras and von Blottnitz (2011)

Lessons

- 💧 **limited number** of detailed LCA assessments are necessary
- 💧 LCA **thinking** can be guided by detailed assessments
- 💧 burden during **operational phase** is much greater than during construction or decommissioning phase
- 💧 **electricity consumption** is a good indicator for environmental burden
- 💧 much of the past **policy is consistent** with recent LCA thinking

- 💧 encourage LCA **thinking**
- 💧 low penetration into **policy** making processes and debates
 - 💧 sanitation policies
 - 💧 **acid mine** drainage option analysis
 - 💧 **water cascade** / reuse / augmentation decisions
 - 💧 industrial effluent discharge **permitting**

The Way Forward

- 💧 analysis of complex system problems
- 💧 identify high impact activities
- 💧 tool to guide research priorities
- 💧 guide improvement trajectories
